EXPERIENCE

AI/LLM Engineer II

Phenom People

April 2025 – Present

Hyderabad, Telangana

- Designed the configuration and policy plane for an enterprise **hiring-integrity / fraud-risk platform**: a global fraud-signal registry with feature groups, tenant-scoped overrides and applicable-context gating, exposed through one **resolve API** consumed by both the reviewer console and the live detection pipeline — with a role-gated signal-lifecycle state machine, versioned definitions that keep every downstream consumer stable across config changes, and CEL-evaluated decision policies (score / condition → action).
- Built the fraud-risk configuration service greenfield in **FastAPI** on **MongoDB** — signal registry, feature groups, audience and scope definitions and tenant-scoped overrides — exposed through an internal resolve endpoint that **Temporal** workflows call at workflow start to decide which fraud signals apply to a candidate and job.
- Merged fraud-risk resolve into the interview-intelligence **Temporal** workflows and removed the **Policy Engine** gating that had decided which checks to run, making the configuration service the **single source of truth** for fraud enablement and replacing hardcoded per-tenant flags with audience rules resolved per candidate.
- Architected **chatbotCXAgent**, a production multi-agent system on **LangGraph** (12 orchestrated nodes) spanning intent recognition, planning, dialogue-state management and tool routing — with **Graph RAG** retrieval over enterprise knowledge and document repositories via FAISS vector search and a Neo4j graph for multi-hop, policy-aware grounding.
- Engineered tool-calling agents that execute governed actions — database queries and structured extraction from unstructured documents — under **XGrammar constrained decoding** and schema-validated JSON guardrails, raising tool-routing accuracy to **91.9%** and eliminating malformed tool calls in live traffic.
- Held the production inference service to a golden baseline of 1.0s median and **1.4s** P95 latency with zero failures across **5,510** requests — a custom Jinja2 chat template disabling the model's thinking mode, required tool-choice and temperature pinned at 0.1 for deterministic tool calls, and eager execution forced because CUDA graphs break on the model's hybrid Mamba-attention architecture — taking the service's test coverage from **7% to 78%**.
- Built conversation analytics APIs covering both live-agent and WhatsApp channels, raised the service's test coverage from **63% to over 90%** while clearing static-analysis code smells, and migrated the service to **FastAPI**.
- Owned tenant provisioning and delivery for the platform — provision and unprovision APIs with region-scoped tenant listing, containerised deployment via **Docker** and **Helm** across staging environments, **OpenTelemetry** instrumentation feeding a metrics dashboard so per-model latency and throughput were visible in production, and production support debugging by querying service logs in **ClickHouse** to resolve customer tickets.
- Use agentic tools in day-to-day development work — **MCP (Model Context Protocol) servers** (ClickHouse, Playwright and Atlassian) through Claude Code as the tool layer for agent development, debugging and issue tracking.

Full Stack Engineer

Blueleaves Farms

May 2022 – February 2025

Hyderabad, Telangana

- Owned end-to-end delivery of production systems (POS, CRM, inventory, procurement, e-commerce) on Node.js, Firebase Cloud Functions and REST APIs — with role-based access control and CI/CD — integrating multiple internal systems and cutting manual operational errors by roughly 90%.
- Built data-driven analytics on large-scale transactional and stock-movement data — demand forecasting, sales-trend and inventory models that surfaced discrepancies and improved procurement/replenishment decisions across 5+ locations and 10,000+ monthly transactions.
- Sole engineer** on the whole stack, working directly with cross-functional stakeholders — **shareholders, company VPs** and external partner businesses — to scope projects and implementations, translating their operational asks into technical designs and delivering them end to end.

PROJECTS

NorthStar — Motorcycle Navigation Companion App | *Android, Kotlin, UDP, RTP, MapLibre*

- Built and shipped a companion app for the **Royal Enfield** Tripper Dash, delivering turn-by-turn navigation to the bike's connected instrument cluster and growing an organic user base without paid distribution; the traction drew **Royal Enfield's** attention directly, leading to an on-site visit at their HQ and a continuing relationship.
- Reverse-engineered the dash's undocumented wire protocol — an **RSA-1024** plus **AES-256** handshake over UDP with auto-discovery of any dash advertising itself on the local network, and an **H.264** over RTP video plane on a separate port.

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript, SQL, Bash

Backend & Infra: FastAPI, Node.js, Express.js, REST APIs, Microservices, Docker, Helm, Temporal, Kafka, AWS (EC2/S3/SageMaker), GitHub Actions, CI/CD, Linux

Databases: PostgreSQL, MongoDB, ClickHouse, Redis, Neo4j, Firebase

Quality & Observability: OpenTelemetry, Langfuse, LiteLLM, Model Monitoring, Schema Validation, Role-Based Access Control, LLM Evaluation (LLM-as-judge, pass@k), Constrained Decoding (XGrammar)

GenAI & Agentic: Agentic / Multi-Agent Systems, LangGraph, LangChain, Tool/Function Calling, RAG & Graph RAG, MCP Servers, Model Routing, LLM Fine-Tuning (QLoRA, SFT)

Frontend & Auth: React, Vite, Micro-Frontends, Keycloak, OAuth / SSO, Design Systems

EDUCATION

Andhra Loyola Institute of Engineering and Technology

Bachelor of Technology in Mechanical Engineering

Vijayawada, Andhra Pradesh

August 2018 – May 2022
